

# BCM<sup>®</sup> Bus Converter

## BCM6135CD1E5165yzz

### Isolated Fixed-Ratio DC-DC Converter

#### Features & Benefits

- Up to 65A continuous low-voltage-side current
- Up to 3.4kW/in<sup>3</sup> power density
- 97.9% peak efficiency
- 4,242V<sub>DC</sub> isolation
- Parallel operation for multi-kW arrays
- OV, OC, UV, short-circuit and thermal protection
- PMBus<sup>®</sup> management interface

#### Typical Applications

- 380V<sub>DC</sub> Power Distribution
- High-End Computing Systems
- High-Density Power Supplies

#### Product Ratings

$V_{HI} = 384V$ (260 – 410V)	$I_{LO} = \text{up to } 65A$
$V_{LO} = 48V$ (32.5 – 51.3V) (NO LOAD)	$K = 1/8$

#### Product Description

The CM-ChiP BCM is a high-efficiency Bus Converter, operating from a 260 – 410V<sub>DC</sub> high-voltage bus to create an isolated ratiometric 32.5 – 51.3V<sub>DC</sub> low-side bus. This ultra-low-profile module is available in a chassis-mount form factor, incorporates a fixed-ratio DC-DC converter and PMBus commands and controls. The BCM provides low output impedance, low noise, fast transient response, high efficiency and high power density. A low-voltage-side-referenced PMBus-compatible telemetry and control interface provides access to the BCM's configuration, fault monitoring and other telemetry functions.

Owing to its megahertz bandwidth and low series impedance, the BCM performs as an efficient capacitance multiplier, enabling bulk capacitance across the 48V bus to be scaled down by a factor of 1/64 across the 384V bus. Capacitance multiplication cuts down the size and number of capacitors required by 48V PoL regulators while freeing up real estate at the point-of-load.

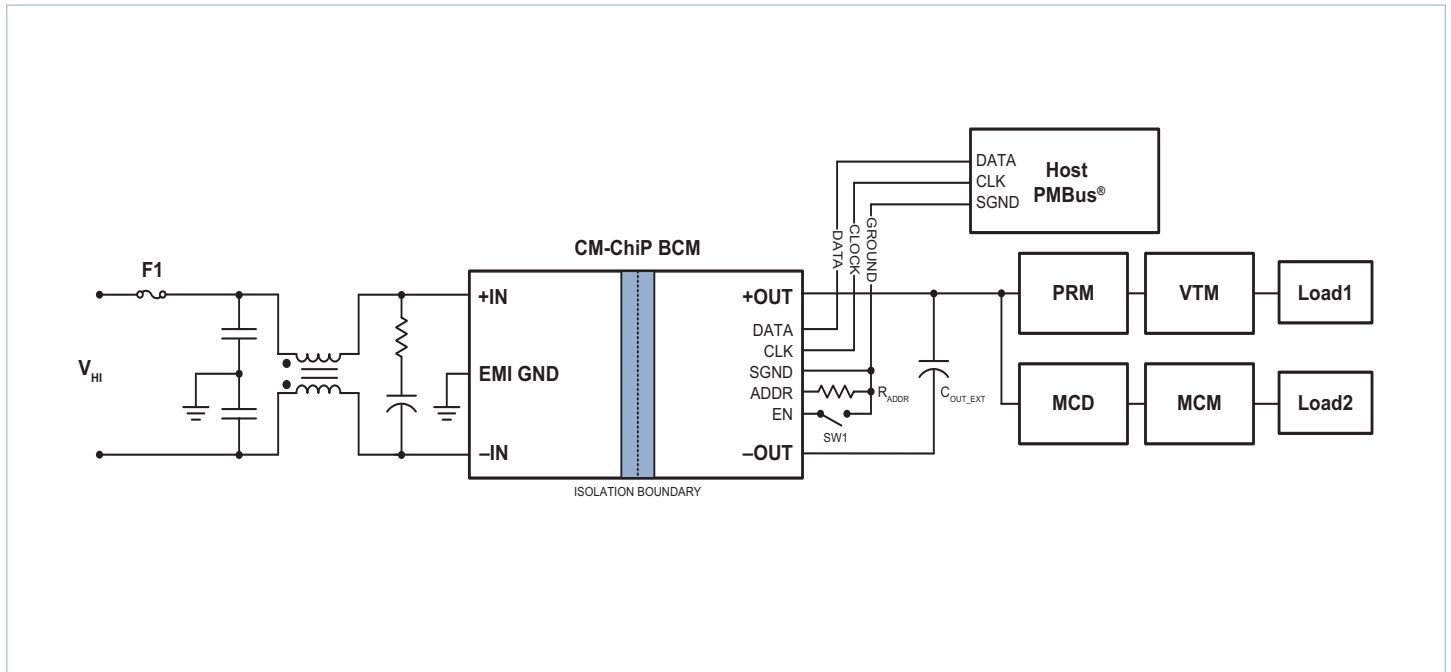

The CM-ChiP BCM module offers flexible thermal management options, with very low top- and bottom-side thermal impedances. Thermally-adept CM-ChiP-based power components enable customers to achieve low-cost power system solutions with previously unattainable system size, weight and efficiency attributes.

#### Package Information

- Chassis-Mount CM-ChiP<sup>™</sup> Package  
2.415 x 1.392 x 0.292in  
[61.33 x 35.35 x 7.42mm]
- Weight: 68g

Note: Product images may not highlight current product markings and cosmetic features.

## Typical Applications

BCM6135CD1E5165yzz with PRM™ + VTM™ and MCD + MCM™

Terminal Configuration

Terminal Descriptions

Power Terminals			
Terminal Number	Signal Name	Type	Function
1	+HI	HIGH SIDE POWER	High-voltage-side positive power terminal
2	EMI GND	EMI GROUND	EMI ground terminal
3	−HI	HIGH SIDE POWER RETURN	High-voltage-side negative power terminal
4	+LO	LOW SIDE POWER	Low-voltage-side positive power terminal
5	−LO	LOW SIDE POWER RETURN	Low-voltage-side negative power terminal
Signal Terminals			
Terminal Number	Signal Name	Type	Function
6	DATA	INPUT / OUTPUT	I <sup>2</sup> C™ data, PMBus® compatible
7	CLK	INPUT	I <sup>2</sup> C clock, PMBus compatible
8	SGND	SIGNAL GROUND	Signal ground
9	ADDR	INPUT	Address assignment, resistor based
10	EN	INPUT	Active-low enable terminal, enables and disables the powertrain

## Part Ordering Information

Part Number	Package Type	Product Grade	Option Field
BCM6135CD1E5165T00	C = CM-ChiP Chassis-Mount	T = -40 to 125°C	00 = Step-Down

## Storage and Handling Information

Attribute	Comments	Specification
Storage Temperature Range	T-Grade	-40 to 125°C
Operating Internal Temperature Range (T <sub>INT</sub> )	T-Grade	-40 to 125°C
Weight		68g
Terminal Finish	C145 Copper	
	Nickel	200µin
	Palladium	30µin
	Hard Gold	3 – 5µin
Package Plating		75µm copper with ENiG surface finish
ESD Rating	Human Body Model JEDEC JS-001-2017	Class 2, 2000V to < 4000V
	Charged Device Model JS-002-2018	Class C2b, 750V to < 1000V

## Reliability and Agency Approvals

Attribute	Comments	Value	Unit
MTBF	Telcordia Issue 2 - Method I Case III; 25°C Ground Benign, Controlled	19.8	MHrs
	MIL-HDBK-217Plus Parts Count - 25°C Ground Benign, Stationary, Indoors / Computer	8.52	
Agency Approvals/Standards	cTÜVus, UL 62368-1, CAN/CSA No. C22.2 62368-1, EN 62368-1		
	cTÜVus, UL 60950-1, CAN/CSA No. C22.2 60950-1, EN 60950-1		
	UKCA, electrical equipment (safety) regulations		
	CE Marked for Low Voltage Directive and RoHS Recast Directive, as applicable		

## Absolute Maximum Ratings

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device.

Parameter	Comments	Min	Max	Unit
+HI to -HI	Powertrain disabled	-1	960	V
	Powertrain enabled		480	V
+LO to -LO		-1	60	V
DATA to SGND		-0.3	5.5	V
CLK to SGND		-0.3	5.5	V
ADDR to SGND		-0.3	3.6	V
Isolation Voltage / Dielectric Withstand	Basic insulation (high-voltage side to case)	2250		V <sub>DC</sub>
	Reinforced insulation (high-voltage side to low-voltage side)	4242		
	Basic insulation (low-voltage side to case)	707		

## Electrical Specifications

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}\text{C} \leq T_{\text{INTERNAL}} \leq 125^{\circ}\text{C}$  (T-Grade). All other specifications are at  $T_{\text{INTERNAL}} = 25^{\circ}\text{C}$  unless otherwise noted.

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
<b>General Powertrain Specification – Forward-Direction Operation (High-Voltage Side to Low-Voltage Side)</b>						
HI-Side Voltage Range, Continuous	$V_{\text{HI\_DC}}$		260	384	410	V
HI-Side Voltage Range, Transient	$V_{\text{IN\_TRANS}}$		260		410	V
HI-Side Voltage Initialization Threshold	$V_{\mu\text{C\_ACTIVE}}$	HI-side voltage where internal bias and controller are initialized (powertrain inactive)		150		V
HI-Side Quiescent Current	$I_{\text{HI\_Q}}$	Disabled, EN inactive state, $V_{\text{HI\_DC}} = 384\text{V}$		2		mA
No-Load Power Dissipation	$P_{\text{HI\_NL}}$	$V_{\text{HI\_DC}} = 384\text{V}$		14	42	W
		$V_{\text{HI\_DC}} = 260 - 410\text{V}$			62	
Transformation Ratio	K	High voltage to low voltage $K = V_{\text{LO\_DC}} / V_{\text{HI\_DC}}$ , at no load		1/8		V / V
LO-Side Current, Continuous	$I_{\text{LO\_OUT\_DC}}$				65	A
LO-Side Current, Pulsed	$I_{\text{LO\_OUT\_PULSE}}$	20ms pulse, 25% duty cycle			78	A

## Signal Characteristics

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}\text{C} \leq T_{\text{INTERNAL}} \leq 125^{\circ}\text{C}$  (T-Grade). All other specifications are at  $T_{\text{INTERNAL}} = 25^{\circ}\text{C}$  unless otherwise noted.

**Please note:** For chassis mount model, Vicor part number 48705-3001R7 or equivalent will be needed for applications requiring the use of the signal terminals. To avoid unnecessary stress on the connector, the cable should be appropriately strain relieved.

### Enable (EN) Terminal

- The EN terminal is a standard analog I/O configured as an input to an internal  $\mu\text{C}$ .
- It is internally pulled high to 3.3V.
- When pulled high, the BCM internal bias will be disabled and the powertrain will be inactive.
- In an array of BCMs, EN terminals should be interconnected to synchronize start up.
- PMBus<sup>®</sup> ON/OFF command has no effect if the BCM EN terminal is not in the active state. This BCM has active low EN terminal logic.

Signal Type	State	Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
Input	Start Up	EN to Powertrain Active Time	$t_{\text{EN\_START}}$	$V_{\text{HL\_DC}} > V_{\text{HL\_UVLO+}}$ , EN active, both conditions satisfied for $t > t_{\text{HL\_UVLO+DELAY}}$		<b>2</b>		ms
	Regular Operation	EN Voltage Threshold	$V_{\text{ENABLE}}$				<b>1</b>	V
		EN Resistance (Internal)	$R_{\text{EN\_INT}}$	Internal pull-up resistor		10		k $\Omega$
		EN Disable Threshold	$V_{\text{EN\_DISABLE\_TH}}$		<b>2.3</b>			V

### SGND Terminal

- All PMBus interface signals (CLK, DATA, ADDR, EN) are referenced to SGND terminal.
- SGND terminal and low-voltage-side power-return terminal (–LO) are common.  
To avoid noise interference, keep SGND signal separated from –LO in electrical design.

### Address (ADDR) Terminal

- This terminal programs the address using a resistor between ADDR terminal and signal ground.
- The address is sampled during start up and is stored until power is reset. This terminal programs only a fixed and persistent address.
- This terminal has an internal 10k $\Omega$  pullup resistor to 3.3V.
- 16 addresses are available. The range of each address is 206.25mV (total range for all 16 addresses is 0 – 3.3V).

Signal Type	State	Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
Multi-Level Input	Regular Operation	ADDR Input Voltage	$V_{\text{SADDR}}$	See address section	0		3.3	V
		ADDR Leakage Current	$I_{\text{SADDR}}$	Leakage current			1	$\mu\text{A}$
	Start Up	ADDR Registration Time	$t_{\text{SADDR}}$	From $V_{\text{VDDB\_MIN}}$		1		ms

## Signal Characteristics (Cont.)

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}\text{C} \leq T_{\text{INTERNAL}} \leq 125^{\circ}\text{C}$  (T-Grade). All other specifications are at  $T_{\text{INTERNAL}} = 25^{\circ}\text{C}$  unless otherwise noted.

**Please note:** For chassis mount model, Vicor part number 48705-3001R7 or equivalent will be needed for applications requiring the use of the signal terminals. To avoid unnecessary stress on the connector, the cable should be appropriately strain relieved.

## Serial Clock input (CLK) and Serial Data (DATA) Terminals

- High-power SMBus specification and SMBus physical layer compatible. Note that optional SMBALERT# is not supported.
- PMBus® command compatible.

Signal Type	State	Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
Digital Input / Output	Regular Operation	<b>Electrical Parameters</b>						
		Input Voltage Threshold	$V_{\text{IH}}$		2.1			V

## BCM in a CM-ChiP™

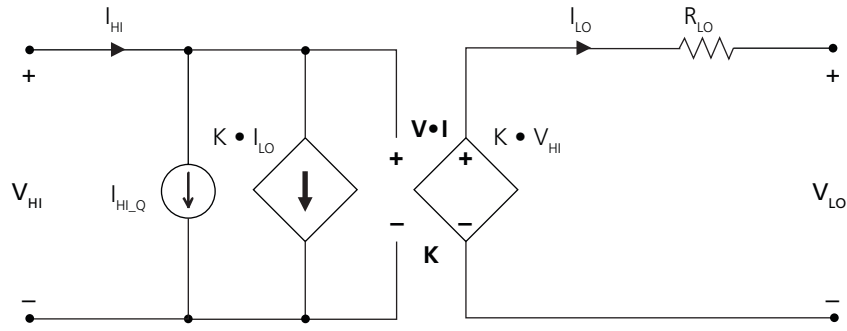

Figure 16 — BCM DC model

The BCM uses a high-frequency resonant tank to move energy from the high-voltage side to low-voltage side and vice versa. The resonant LC tank, operated at high frequency, is amplitude modulated as a function of the high-side voltage and the low-side current. A small amount of capacitance embedded in the high-voltage-side and low-voltage stages of the module is sufficient for full functionality and is key to achieving high power density.

The BCM6135CD1E5165Yzz can be simplified into the model shown in Figure 16.

At no load:

$$V_{LO} = V_{HI} \cdot K \quad (1)$$

K represents the “turns ratio” of the BCM.

Rearranging Equation 1:

$$K = \frac{V_{LO}}{V_{HI}} \quad (2)$$

In the presence of a load,  $V_{LO}$  is represented by:

$$V_{LO} = V_{HI} \cdot K - I_{LO} \cdot R_{LO} \quad (3)$$

and  $I_{LO}$  is represented by:

$$I_{LO} = \frac{I_{HI} - I_{HI\_Q}}{K} \quad (4)$$

$R_{LO}$  represents the impedance of the BCM, and is a function of the  $R_{DS\_ON}$  of the high-voltage-side and low-voltage-side MOSFETs and the winding resistance of the power transformer.  $I_{HI\_Q}$  represents the quiescent current of the BCM controller, gate drive circuitry and core losses.

The effective DC voltage transformer action provides additional interesting attributes. Assuming that  $R_{LO} = 0\Omega$  and  $I_{HI\_Q} = 0A$ , Equation 3 now becomes Equation 1 and is essentially load independent, resistor R is now placed in series with  $V_{HI}$ .

Figure 17 — K = 1/8 BCM with series high-voltage-side resistor

The relationship between  $V_{HI}$  and  $V_{LO}$  becomes:

$$V_{LO} = (V_{HI} - I_{HI} \cdot R) \cdot K \quad (5)$$

Substituting the simplified version of Equation 4 ( $I_{HI\_Q}$  is assumed = 0A) into Equation 5 yields:

$$V_{LO} = V_{HI} \cdot K - I_{LO} \cdot R \cdot K^2 \quad (6)$$

This is similar in form to Equation 3, where  $R_{LO}$  is used to represent the characteristic impedance of the BCM. However, in this case a real resistor, R on the high-voltage side of the BCM is effectively scaled by  $K^2$  with respect to the low-voltage side.

Assuming that  $R = 1\Omega$ , the effective R as seen from the low-voltage side is  $16m\Omega$ , with  $K = 1/8$ .

A similar exercise can be performed with the addition of a capacitor or shunt impedance at the high-voltage side of the BCM. A switch in series with  $V_{HI}$  is added to the circuit. This is depicted in Figure 18.

**Figure 18** — BCM with high-voltage-side capacitor

A change in  $V_{HI}$  with the switch closed would result in a change in capacitor current according to the following equation:

$$I_c(t) = C \frac{dV_{HI}}{dt} \quad (7)$$

Assume that with the capacitor charged to  $V_{HI}$ , the switch is opened and the capacitor is discharged through the idealized BCM. In this case,

$$I_c = I_{LO} \cdot K \quad (8)$$

substituting Equation 1 and 8 into Equation 7 reveals:

$$I_{LO}(t) = \frac{C}{K^2} \cdot \frac{dV_{LO}}{dt} \quad (9)$$

The equation in terms of the low-voltage side has yielded a  $K^2$  scaling factor for  $C$ , specified in the denominator of the equation.

A  $K$  factor less than unity results in an effectively larger capacitance on the low-voltage side when expressed in terms of the high-voltage side. With  $K = 1/8$  as shown in Figure 18,  $C = 1\mu F$  would appear as  $C = 64\mu F$  when viewed from the low-voltage side.

Low impedance is a key requirement for powering a high-current, low-voltage load efficiently. A switching regulation stage should have minimal impedance while simultaneously providing appropriate filtering for any switched current. The use of a BCM between the regulation stage and the point of load provides a dual benefit of scaling down series impedance leading back to the source and scaling up shunt capacitance or energy storage as a function of its  $K$  factor squared. However, these benefits are not achieved if the series impedance of the BCM is too high. The impedance of the BCM must be low, i.e., well beyond the crossover frequency of the system.

A solution for keeping the impedance of the BCM low involves switching at a high frequency. This enables the use of small magnetic components because magnetizing currents remain low. Small magnetics mean small path lengths for turns. Use of low-loss core material at high frequencies also reduces core losses.

The two main terms of power loss in the BCM are:

- No load power dissipation ( $P_{HI\_NL}$ ): defined as the power used to power up the module with an enabled powertrain at no load.
- Resistive loss ( $P_{R_{LO}}$ ): refers to the power loss across the BCM modeled as pure resistive impedance.

$$P_{DISSIPATED} = P_{HI\_NL} + P_{R_{LO}} \quad (10)$$

Therefore,

$$P_{LO\_OUT} = P_{HI\_IN} - P_{DISSIPATED} = P_{HI\_IN} - P_{HI\_NL} - P_{R_{LO}} \quad (11)$$

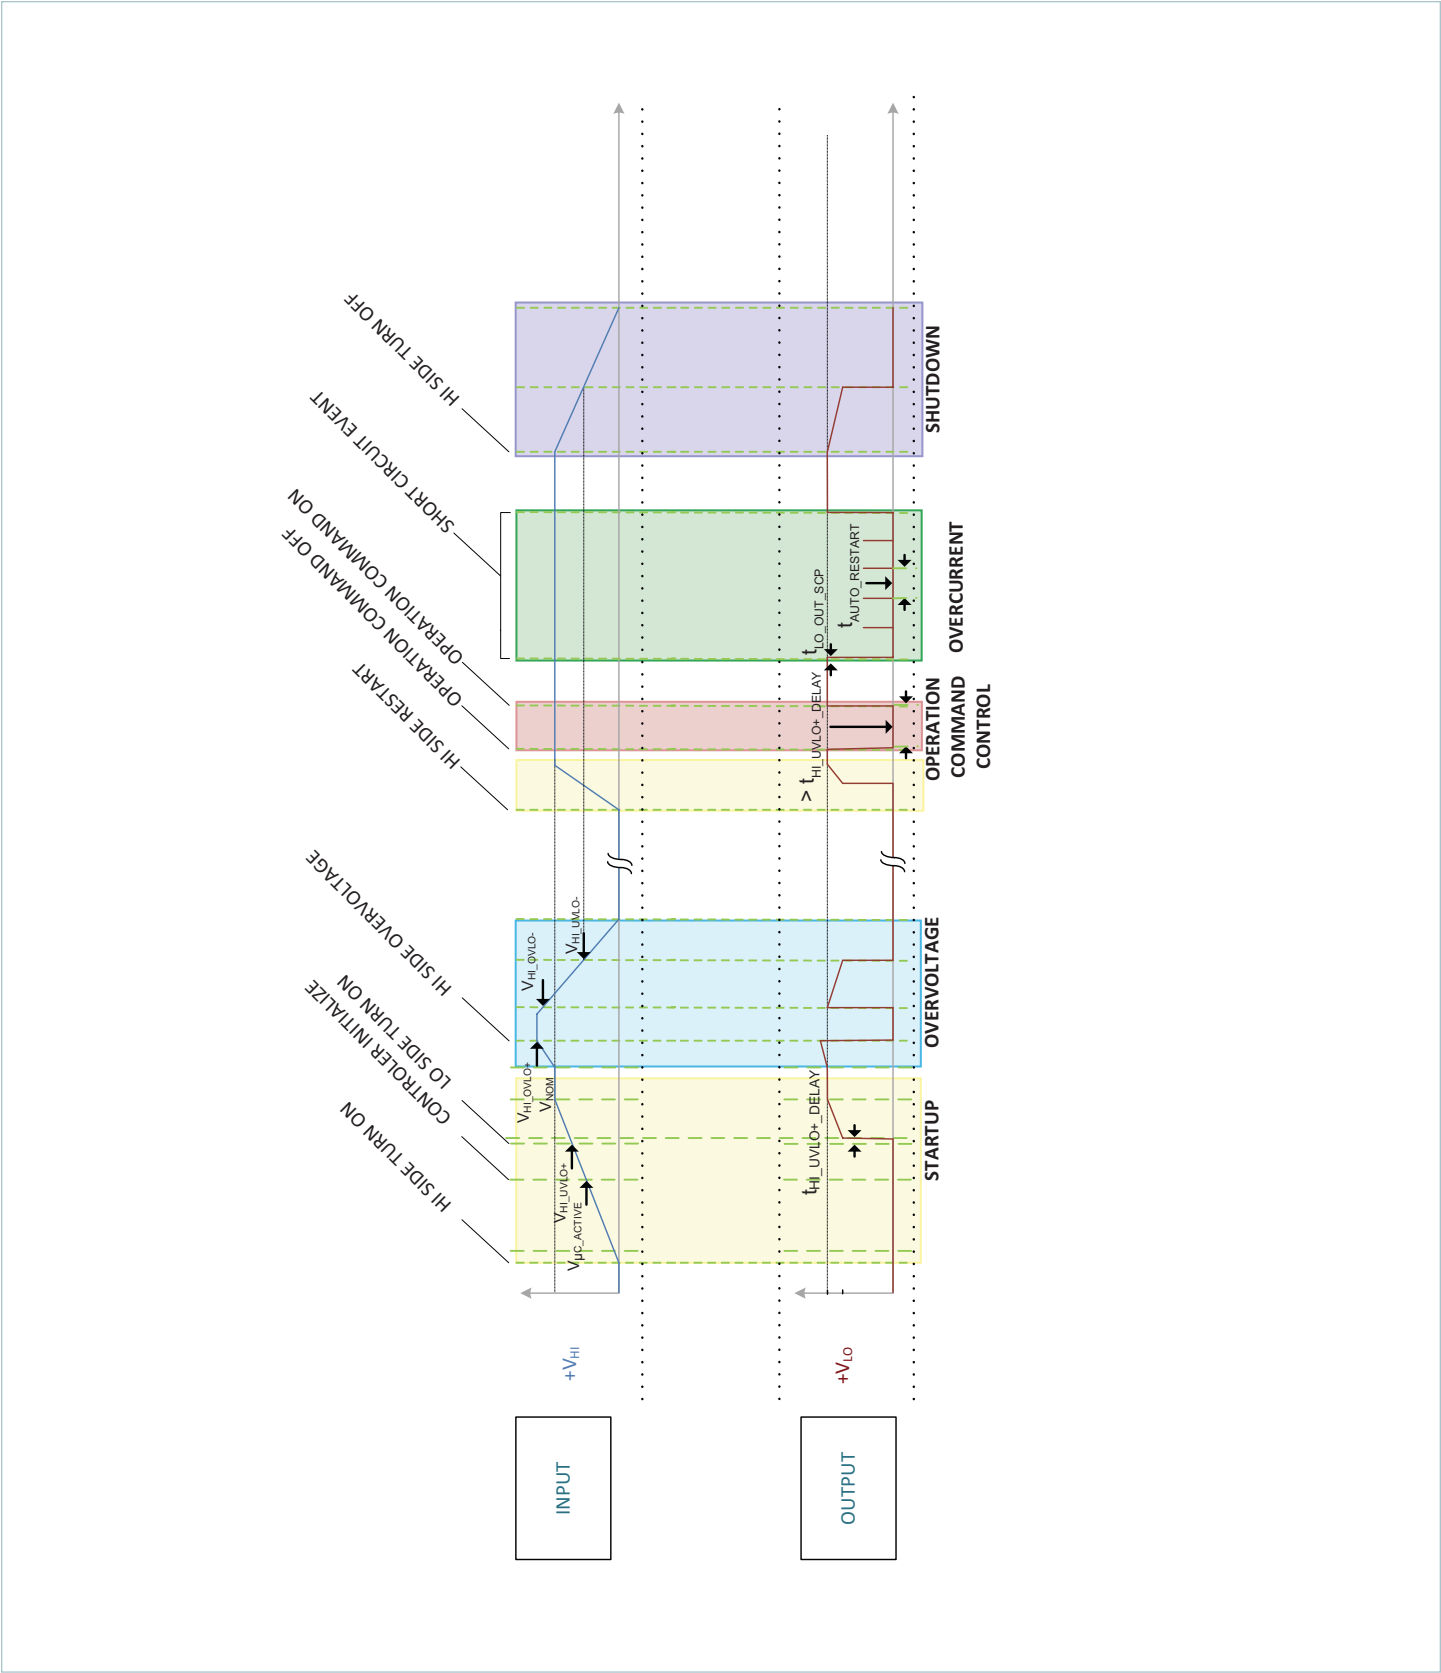

The above relations can be combined to calculate the overall module efficiency:

$$\eta = \frac{P_{LO\_OUT}}{P_{HI\_IN}} = \frac{P_{HI\_IN} - P_{HI\_NL} - P_{R_{LO}}}{P_{HI\_IN}} \quad (12)$$

$$= \frac{V_{HI} \cdot I_{HI} - P_{HI\_NL} - (I_{LO})^2 \cdot R_{LO}}{V_{HI} \cdot I_{HI}}$$

$$= 1 - \left( \frac{P_{HI\_NL} + (I_{LO})^2 \cdot R_{LO}}{V_{HI} \cdot I_{HI}} \right)$$

Timing Diagram (Forward Direction)

## Input and Output Filter Design

A major advantage of BCM systems versus conventional PWM converters is that the transformer based BCM does not require external filtering to function properly. The resonant LC tank, operated at extreme high frequency, is amplitude modulated as a function of high-voltage-side voltage and low-voltage-side current and efficiently transfers charge through the isolation transformer. A small amount of capacitance embedded in the high-voltage-side and low-voltage-side stages of the module is sufficient for full functionality and is key to achieving power density.

This paradigm shift requires system design to carefully evaluate external filters in order to:

### ■ *Guarantee low source impedance:*

To take full advantage of the BCM's dynamic response, the impedance presented to its high-voltage-side terminals must be low from DC to approximately 5MHz. The connection of the bus converter module to its power source should be implemented with minimal distribution inductance. If the interconnect inductance exceeds 100nH, the input should be bypassed with a RC damper to retain low source impedance and stable operation. With an interconnect inductance of 200nH, the RC damper may be as high as 1μF in series with 0.3Ω. A single electrolytic or equivalent low-Q capacitor may be used in place of the series RC bypass.

### ■ *Further reduce high-voltage-side and/or low-voltage-side voltage ripple without sacrificing dynamic response:*

Given the wide bandwidth of the module, the source response is generally the limiting factor in the overall system response. Anomalies in the response of the high-voltage-side source will appear at the low-voltage side of the module multiplied by its K factor.

### ■ *Protect the module from overvoltage transients imposed by the system that would exceed maximum ratings and induce stresses:*

The module high- and low-voltage-side voltage ranges shall not be exceeded. An internal overvoltage lockout function prevents operation outside of the normal operating high-voltage-side range. Even when disabled, the powertrain is exposed to the applied voltage and the power MOSFETs must withstand it.

Total load capacitance at the low-voltage side of the BCM shall not exceed the specified maximum. Owing to the wide bandwidth and minimal low-voltage-side impedance of the module, low-frequency bypass capacitance and significant energy storage may be more densely and efficiently provided by adding capacitance at the high-voltage side of the module. At frequencies <500kHz the module appears as an impedance of  $R_{LO}$  between the source and load.

Within this frequency range, capacitance at the high-voltage side appears as effective capacitance on the low-voltage side per the relationship defined in Equation 13.

$$C_{LO} = \frac{C_{HI}}{K^2} \quad (13)$$

This enables a reduction in the size and number of capacitors used in a typical system.

## Current Sharing

The performance of the BCM topology is based on efficient transfer of energy through a transformer without the need of closed loop control. For this reason, the transfer characteristic can be approximated by an ideal transformer with a positive temperature coefficient series resistance.

This type of characteristic is close to the impedance characteristic of a DC power distribution system both in dynamic (AC) behavior and for steady state (DC) operation.

When multiple BCMs of a given part number are connected in an array, they will inherently share the load current according to the equivalent impedance divider that the system implements from the power source to the point of load. Ensuring equal current sharing among modules requires that BCM array impedances be matched.

Some general recommendations to achieve matched array impedances include:

- Dedicate common copper planes within the PCB to deliver and return the current to the modules.
- Provide as symmetric a PCB layout as possible among modules
- A dedicated input filter for each BCM in an array is required to prevent circulating currents.

For further details see:

[AN:016 Using BCM Bus Converters in High Power Arrays.](#)

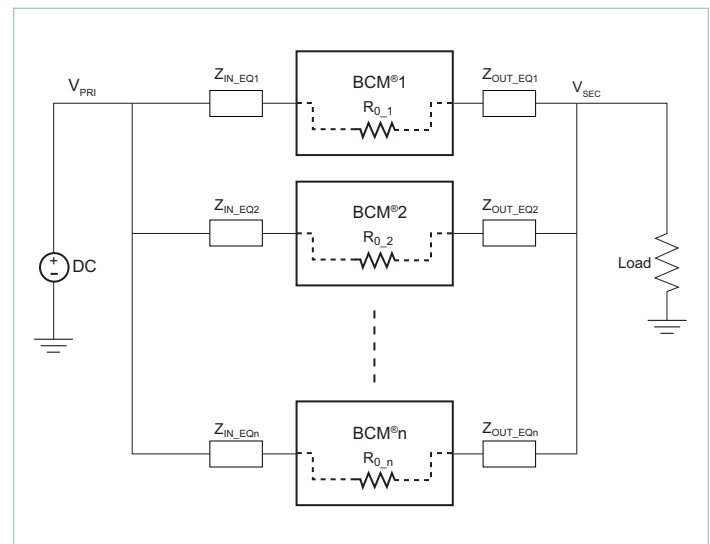

Figure 19 — BCM parallel array

## Fuse Selection

In order to provide flexibility in configuring power systems, CM-ChiP™ modules are not internally fused. Input line fusing of CM-ChiP products is recommended at the system level to provide thermal protection in case of catastrophic failure.

The fuse shall be selected by closely matching system requirements with the following characteristics:

- Current rating  
(usually greater than maximum current of BCM)
- Maximum voltage rating  
(usually greater than the maximum possible input voltage)
- Ambient temperature
- Nominal melting  $I^2t$
- Recommend fuse: See safety agency approvals.

## Thermal Considerations

The CM-ChiP™ module provides a high degree of flexibility in that it presents several pathways to remove heat from the internal power dissipating components. Heat may be removed from the top surface, the bottom surface and the high- and low-voltage-side power terminals. The extent to which these surfaces are cooled is a key component in determining the maximum current that is available from a CM-ChiP.

Since the CM-ChiP has a maximum internal temperature rating, it is necessary to estimate this internal temperature based on a system-level thermal solution. Given that there are multiple pathways to remove heat from the CM-ChiP, it is helpful to simplify the thermal solution into a roughly equivalent circuit

where power dissipation is modeled as a current source, isothermal surface temperatures are represented as voltage sources and the thermal resistances are represented as resistors.

Figure 20 shows the “thermal circuit” for a BCM6135 CM-ChiP in a two-sided cooling application, where the product is cooled through a heat sink at the bottom and a separate heat sink at the top. In this case, the BCM top and bottom (each heat sink) surface temperatures are represented as  $T_{\text{TERMINAL\_SIDE}}$  and  $T_{\text{NON-TERMINAL\_SIDE}}$ . This thermal system can now be very easily analyzed as an electrical network with simple resistors, voltage sources and a current source. The results of the simulation provide an estimate of heat flow through the various dissipation pathways as well as internal temperature.

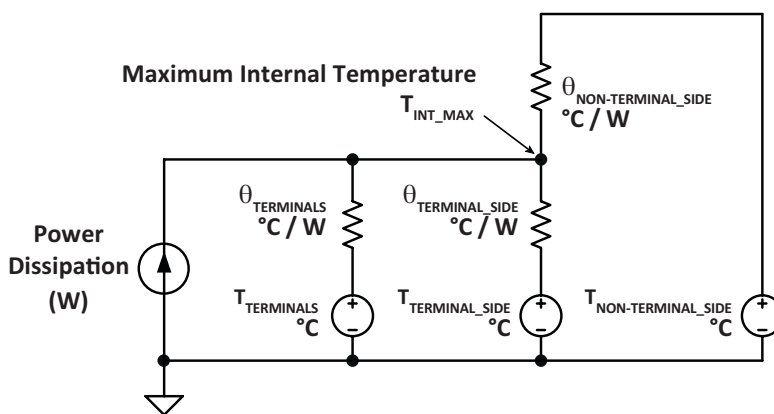

Figure 20 — Two-sided cooling thermal model

Symbol	Thermal Impedance (°C / W)	Definition of Estimated Thermal Resistance
$\theta_{\text{TERMINALS}}$	3.6	From the hottest component inside the BCM to the high- and low-voltage-side terminals
$\theta_{\text{TERMINAL\_SIDE}}$	1.1	From the hottest component inside the BCM to the terminal-side package surface
$\theta_{\text{NON-TERMINAL\_SIDE}}$	0.85	From the hottest component inside the BCM to the non-terminal-side package surface

Table 1 — Thermal impedances

## System Diagram for PMBus Interface

## PMBus Interface

Refer to “PMBus® Power System Management Protocol Specification Revision 1.3, Part I and II” for complete PMBus specifications details at <https://pmbus.org>.

## Device Address

The PMBus address (ADDR terminal) should be set to one of the predetermined 16 possible addresses shown in the table below using a resistor between the ADDR terminal and SGND terminal.

The BCM accepts only a fixed and persistent address and does not support SMBus address resolution protocol. At initial power up, the BCM controller will sample the address terminal voltage and will keep this address until device power is removed.

ID	Child Address	HEX	Recommended Resistor R <sub>ADDR</sub> (Ω)
1	1010 000b	50h	487
2	1010 001b	51h	1050
3	1010 010b	52h	1870
4	1010 011b	53h	2800
5	1010 100b	54h	3920
6	1010 101b	55h	5230
7	1010 110b	56h	6810
8	1010 111b	57h	8870
9	1011 000b	58h	11300
10	1011 001b	59h	14700
11	1011 010b	5Ah	19100
12	1011 011b	5Bh	25500
13	1011 100b	5Ch	35700
14	1011 101b	5Dh	53600
15	1011 110b	5Eh	97600
16	1011 111b	5Fh	316000

## Reported DATA Formats

The BCM controller employs a direct data format where all reported measurements are in volts, amperes, degrees Celsius or seconds. The Host uses the following PMBus specification to interpret received values metric prefixes. Note that the COEFFICIENTS command is not supported:

$$X = \left( \frac{1}{m} \right) \cdot (Y \cdot 10^R - b)$$

Where:

X, is a “real world” value in units (A, V, °C, s)

Y, is a two’s complement integer received from the BCM controller

m, b and R are two’s complement integers defined as follows:

Command	Code	m	R	b
OT_FAULT_LIMIT	4Fh	1	2	0
OT_WARN_LIMIT	50h	1	2	0
TON_DELAY	60h	1	3	0
READ_EOUT	87h	1	0	0
READ_VIN	88h	1	1	0
READ_VOUT	8Bh	1	2	0
READ_IOUT	8Ch	1	2	0
READ_TEMPERATURE_1	8Dh	1	0	0
READ_POUT	96h	1	0	0
MFR_VIN_MIN	A0h	1	0	0
MFR_VIN_MAX	A1h	1	0	0
MFR_VOUT_MIN	A4h	1	0	0
MFR_VOUT_MAX	A5h	1	0	0
MFR_IOUT_MAX	A6h	1	0	0
MFR_POUT_MAX	A7h	1	0	0
READ_K_FACTOR	D1h	65536	0	0

No special formatting is required when modifying the supervisory limits and warnings.

## Supported Command List

Command	Code	Function	Default Data Content	SMBus Write Transaction	SMBus Read Transaction	Data Bytes
OPERATION	01h	Turn BCM on or off	80h	Write Byte	Read Byte	1
ON_OFF_CONFIG	02h	Defines startup when power is applied as well as immediate on/off control over the BCM	1Dh	N/A	Read Byte	1
CLEAR_FAULTS	03h	Clear all faults	N/A	Send Byte	N/A	None
CAPABILITY	19h	PMBus® key capabilities set by factory	A0h	N/A	Read Byte	1
OT_FAULT_LIMIT	4Fh <sup>[g]</sup>	Overtemperature protection	64h	Write Word	Read Word	2
OT_WARN_LIMIT	51h <sup>[g]</sup>	Overtemperature warning	64h	Write Word	Read Word	2
TON_DELAY	60h <sup>[g]</sup>	Startup delay in addition to fixed delay	01h	Write Word	Read Word	2
STATUS_BYTE	78h	Summary of faults	00h	Write Byte	Read Byte	1
STATUS_WORD	79h	Summary of fault conditions	00h	Write Word	Read Word	2
STATUS_IOUT	7Bh	Overcurrent fault status	00h	N/A	Read Byte	1
STATUS_INPUT	7Ch	Overvoltage and undervoltage fault status	00h	N/A	Read Byte	1
STATUS_TEMPERATURE	7Dh	Overtemperature and undertemperature fault status	00h	N/A	Read Byte	1
STATUS_CML	7Eh	PMBus communication fault	00h	Write Byte	Read Byte	1
STATUS_MFR_SPECIFIC	80h	Other BCM status indicator	00h	Write Byte	Read Byte	1
READ_EOUT	87h	Output energy meter data	00h	N/A	Block Read	6
READ_VIN	88h	Reads high side voltage	FFFFh	N/A	Read Word	2
READ_VOUT	8Bh	Reads low side voltage	FFFFh	N/A	Read Word	2
READ_IOUT	8Ch	Reads low side current	FFFFh	N/A	Read Word	2
READ_TEMPERATURE_1	8Dh	Reads internal temperature	FFFFh	N/A	Read Word	2
READ_POUT	96h	Reads low side power	FFFFh	N/A	Read Word	2
PMBUS_REVISION	98h	PMBus-compatible revision	33h	N/A	Read Byte	1
MFR_ID	99h	Internal controller ID	“V1”	N/A	Block Read	2
MFR_MODEL	9Ah	Internal controller or BCM model	Part Number	N/A	Block Read	18
MFR_REVISION	9Bh	Internal controller or BCM revision	FW and HW revision	N/A	Block Read	18
MFR_LOCATION	9Ch	Internal controller or BCM factory location	“AP”	N/A	Block Read	2
MFR_DATE	9Dh	Internal controller or BCM manufacturing date	“YYWW”	N/A	Block Read	4
MFR_SERIAL	9Eh	Internal controller or BCM serial number	Serial Number	N/A	Block Read	16
MFR_VIN_MIN	A0h	Minimum rated high side voltage	Varies per BCM	N/A	Read Word	2
MFR_VIN_MAX	A1h	Maximum rated high side voltage	Varies per BCM	N/A	Read Word	2
MFR_VOUT_MIN	A4h	Minimum rated low side voltage	Varies per BCM	N/A	Read Word	2
MFR_VOUT_MAX	A5h	Maximum rated low side voltage	Varies per BCM	N/A	Read Word	2
MFR_IOUT_MAX	A6h	Maximum rated low side current	Varies per BCM	N/A	Read Word	2
MFR_POUT_MAX	A7h	Maximum rated low side power	Varies per BCM	N/A	Read Word	2
READ/WRITE USER DATA_00	B0h	Custom user data space	00h	Block Write	Block Read	29
READ/WRITE USER DATA_01	B1h	Custom user data space	00h	Block Write	Block Read	29
READ/WRITE USER DATA_02	B2h	Custom user data space	00h	Block Write	Block Read	255
READ/WRITE USER DATA_03	B3h	Custom user data space	00h	Block Write	Block Read	255
BCM_EN_POLARITY	D0h <sup>[g]</sup>	Set BCM EN terminal polarity	00h	Write Byte	Read Byte	1
READ_K_FACTOR	D1h	Reads K factor	Varies per BCM	N/A	Read Word	2

<sup>[g]</sup> The BCM must be in a disabled state by either EN terminal control or OPERATION (01h) off command during a write message.

## Command Structure Overview

### Write Byte protocol:

The Host always initiates PMBus® communication with a START bit. All messages are terminated by the Host with a STOP bit. In a write message, the parent sends the child device address followed by a write bit. Once the child acknowledges, the parent proceeds with the command code and then similarly the data byte.

**S** Start Condition

**Sr** Repeated Start Condition

**Rd** Read

**Wr** Write

**X** Indicated that field is required to have the value of x

**A** Acknowledge (bit may be 0 for an ACK or 1 for a NACK)

**P** Stop Condition

From Parent to Child

From Child to Parent

... Continued next line

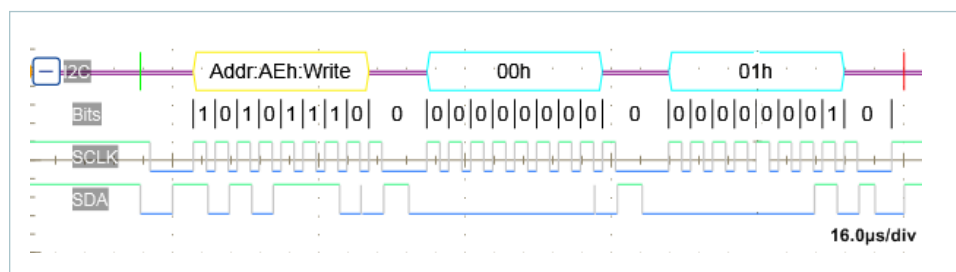

Figure 22 — PAGE COMMAND (00h), WRITE BYTE PROTOCOL

### Write Byte with PEC (Packet Error Checking) Protocol:

### Read Byte protocol:

A Read message begins by first sending a Write Command, followed by a REPEATED START Bit and a child Address. After receiving the READ bit, the BCM controller begins transmission of the Data responding to the Command. Once the Host receives the requested Data, it terminates the message with a NACK preceding a stop condition signifying the end of a read transfer.

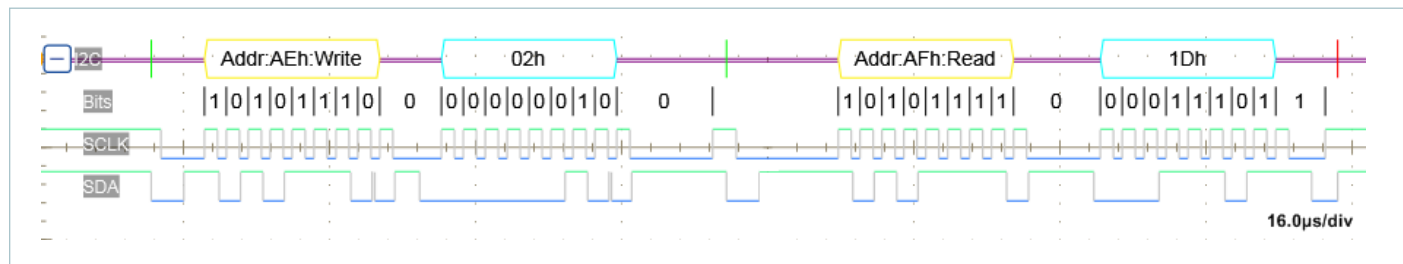

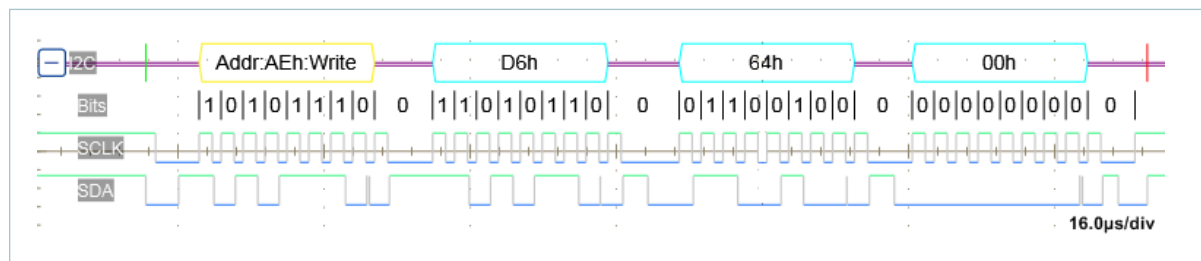

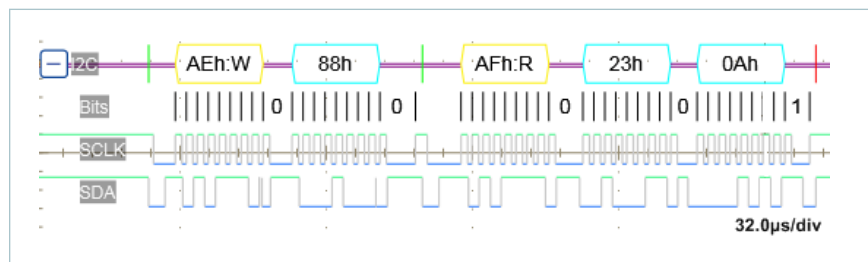

Figure 23 — ON\_OFF\_CONFIG COMMAND (02h), READ BYTE PROTOCOL

**Write Word protocol:**

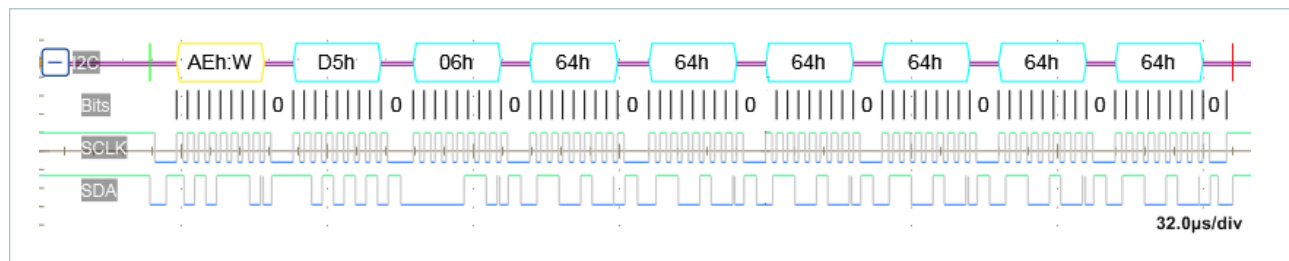

When transmitting a word, the lowest order byte leads the highest order byte. Furthermore, when transmitting a Byte, the least significant bit (LSB) is sent last. Refer to System Management Bus (SMBus) specification version 2.0 for more details.

**Figure 24** — TON\_DELAY COMMAND (D6h)\_WRITE WORD PROTOCOL

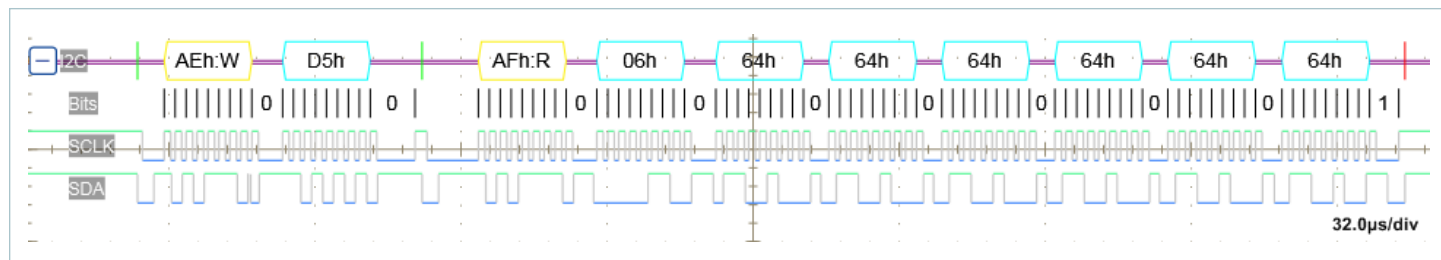

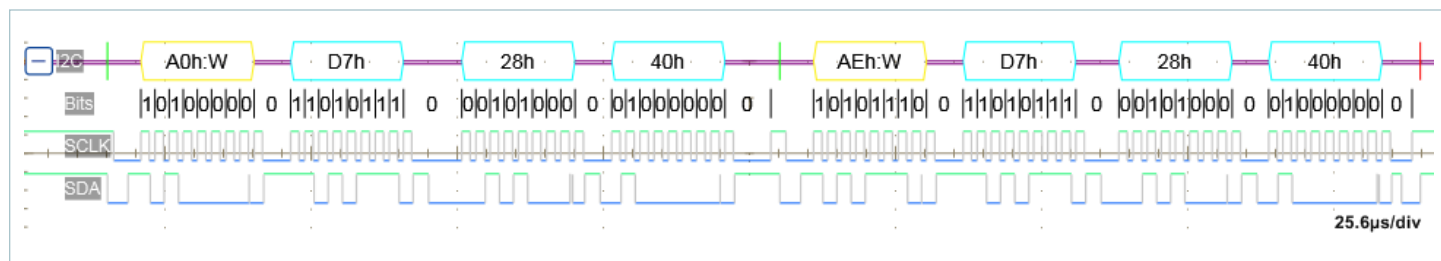

**Read Word protocol:**

**Figure 25** — MFR\_VIN\_MIN COMMAND (88h)\_READ WORD PROTOCOL

**Write Block protocol:**

**Read Block protocol:****Figure 27** — SET\_ALL\_THRESHOLDS COMMAND (D5h)\_READ BLOCK PROTOCOL**Write Group Command protocol:****Figure 28** — DISABLE\_FAULT COMMAND (D7h)\_WRITE

Note that only one command per device is allowed in a group command.

## Supported Commands Transaction Type

Supported command access privileges are defined in the following table. Deviation from this table generates a communication error in STATUS\_CML register.

Command	Code	PAGE Data Byte Access Type
OPERATION	01h	R/W
ON_OFF_CONFIG	02h	R
CLEAR_FAULTS	03h	W
CAPABILITY	19h	R
OT_FAULT_LIMIT	4Fh	R/W
OT_WARN_LIMIT	51h	R/W
TON_DELAY	60h	R/W
STATUS_BYTE	78h	R/W
STATUS_WORD	79h	R/W
STATUS_IOUT	7Bh	R
STATUS_INPUT	7Ch	R
STATUS_TEMPERATURE	7Dh	R
STATUS_CML	7Eh	R/W
STATUS_MFR_SPECIFIC	80h	R/W
READ_EOUT	87h	R
READ_VIN	88h	R
READ_VOUT	8Bh	R
READ_IOUT	8Ch	R
READ_TEMPERATURE_1	8Dh	R
READ_POUT	96h	R
PMBUS_REVISION	98h	R
MFR_ID	99h	R
MFR_MODEL	9Ah	R
MFR_REVISION	9Bh	R
MFR_LOCATION	9Ch	R
MFR_DATE	9Dh	R
MFR_SERIAL	9Eh	R
MFR_VIN_MIN	A0h	R
MFR_VIN_MAX	A1h	R
MFR_VOUT_MIN	A4h	R
MFR_VOUT_MAX	A5h	R
MFR_IOUT_MAX	A6h	R
MFR_POUT_MAX	A7h	R
READ/WRITE USER DATA_00	B0h	R/W
READ/WRITE USER DATA_01	B1h	R/W
READ/WRITE USER DATA_02	B2h	R/W
READ/WRITE USER DATA_03	B3h	R/W
BCM_EN_POLARITY	D0h	R/W

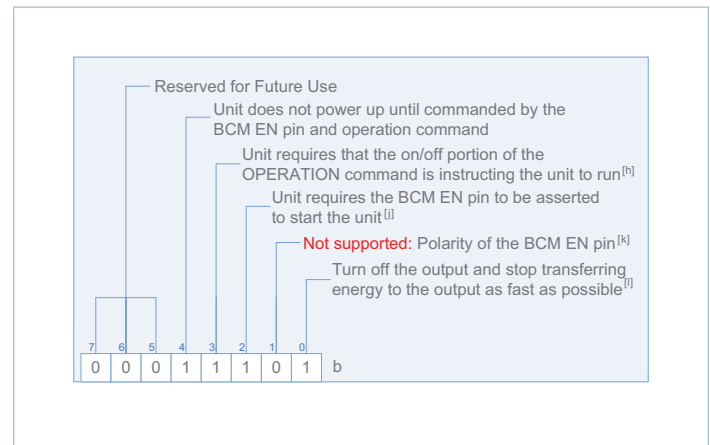

## OPERATION Command (01h)

The OPERATION command and the BCM EN terminal can both be used to turn on and off the connected BCM. Note that the Host OPERATION command will not enable the BCM if the BCM EN terminal is disabled in hardware with respect to the pre-set terminal polarity. The OPERATION command provides ON/OFF control only with the BCM EN terminal active.

If synchronous start up is required in the system, it is recommended to use the command from Host PMBus® or the BCM EN terminal in order to achieve simultaneous array start up.

## ON\_OFF\_CONFIG Command (02h)

<sup>[h]</sup> The BCM EN terminal is ALWAYS to be asserted for power up.

The BCM\_EN\_POLARITY command (D0h) bit[1] defines the logic level required for the control terminal (i.e., BCM Enable terminal) to be asserted.

<sup>[i]</sup> With respect to the BCM EN terminal if used in system.

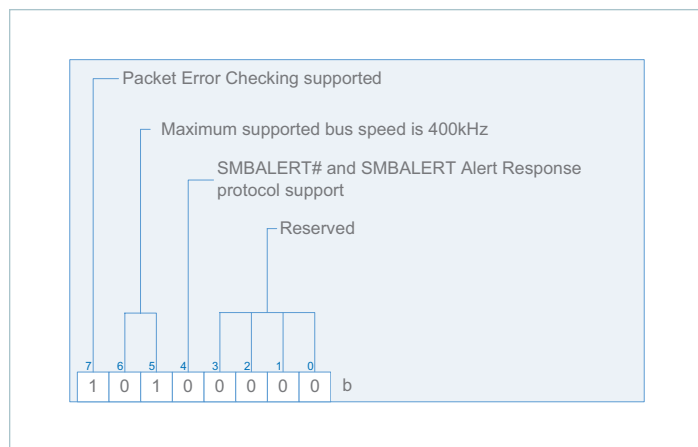

<sup>[k]</sup> See MFR\_SPECIFIC\_00 / BCM\_EN\_POLARITY to change the Polarity of the BCM Enable terminal.

<sup>[l]</sup> The BCM powertrain once disabled cannot sink current.

### CLEAR\_FAULTS Command (03h)

This command clears all status bits that have been previously set. Persistent or active faults are re-asserted again once cleared. All faults are latched once asserted in the BCM. Registered faults will not be cleared when disabling the BCM powertrain by the EN terminal, sending the OPERATION command, or by lowering the high side voltage below the undervoltage protection threshold.

### CAPABILITY Command (19h)

The BCM returns a default value of A0h. This value indicates that the PMBus® frequency supported is up to 400kHz and that Packet Error Checking (PEC) is supported. SMBALERT# is not supported.

### OT\_FAULT\_LIMIT Command (4Fh), OT\_WARN\_LIMIT Command (51h),

The values of these registers are set in non-volatile memory and can only be written when the BCM is disabled.

The values of the above mentioned faults and warnings are set by default to 100% of the respective BCM model supervisory limits. However, these limits can be set to a lower value. For example: In order for a limit percentage to be set to 80%, one would send a write command with a (50h) Data Word.

Any values outside the range of (00h – 64h) sent by a Host will be rejected, will not override the currently stored value and will set the Unsupported Data bit in STATUS\_CML.

All FAULT\_RESPONSE commands are unsupported. The BCM powertrain supervisory limits and powertrain protection will behave as described in the Electrical Specifications. In general, once a fault is detected, the BCM powertrain will shut down and attempt to auto-restart after a predetermined delay.

### TON\_DELAY Command (60h)

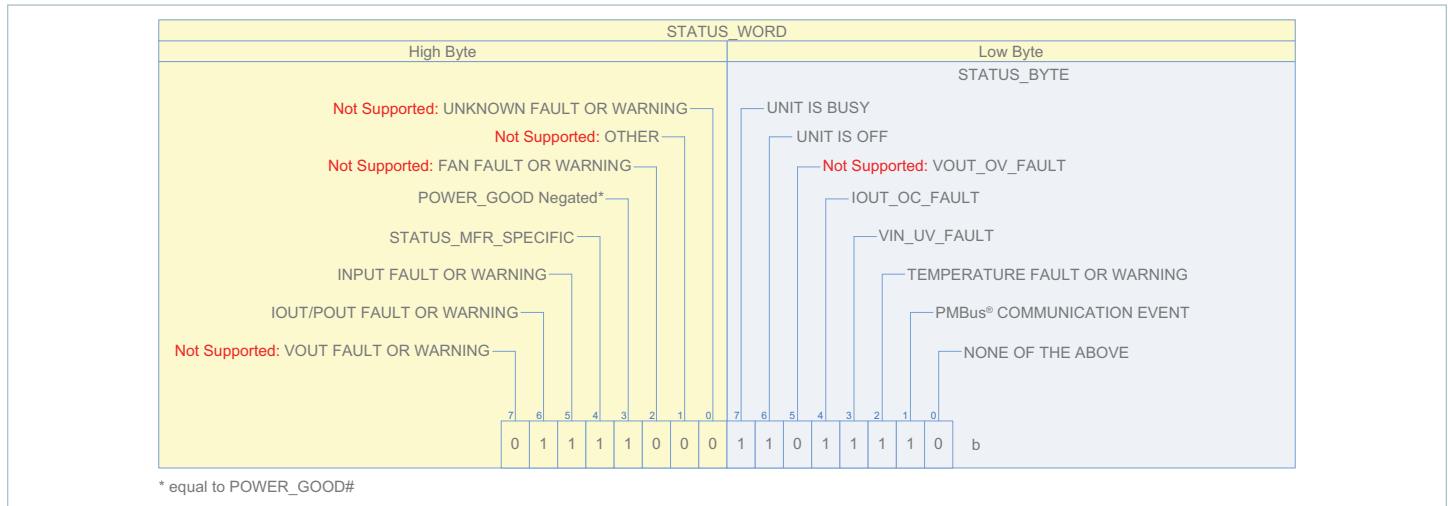

The value of this register word is set in non-volatile memory and can only be written when the BCM is disabled.

The maximum possible delay is 100ms. Default value is set to (01h). The reported value can be interpreted using the following equation.

$$TON\_DELAY_{ACTUAL} = t_{REPORTED} \cdot 10^{-3}(s)$$

Staggering start up in an array is possible with the TON\_DELAY Command. This delay will be in addition to any start-up delay inherent in the BCM module. For example: start-up delay from application of  $V_{IN}$  is typically 20ms. When TON\_DELAY is greater than zero, the set delay will be added to it.

## STATUS\_BYTE (78h) and STATUS\_WORD (79h)

All fault or warning flags, if set, will remain asserted until cleared by the Host or once the BCM input power is removed.

This includes undervoltage fault, overvoltage fault, overtemperature fault, overtemperature warning, undertemperature fault and communication faults.

Asserted status bits in all status registers, with the exception of STATUS\_WORD and STATUS\_BYTE, can be individually cleared. This is done by sending a data byte with one in the bit position corresponding to the intended warning or fault to be cleared. Refer to the PMBus® Power System Management Protocol Specification – Part II – Revision 1.3 for details.

The POWER\_GOOD# bit reflects the state of the device and does not reflect the state of the POWER\_GOOD# signal limits. The POWER\_GOOD\_ON COMMAND (5Eh) and POWER\_GOOD\_OFF COMMAND (5Fh) are not supported. The POWER\_GOOD# bit is set, when the BCM is not in the active state, to indicate that the powertrain is inactive and not switching. The POWER\_GOOD# bit is cleared, when the BCM is in the active state, 5ms after the powertrain is activated allowing for soft start to elapse.

POWER\_GOOD# and OFF bits cannot be cleared as they always reflect the current state of the device.

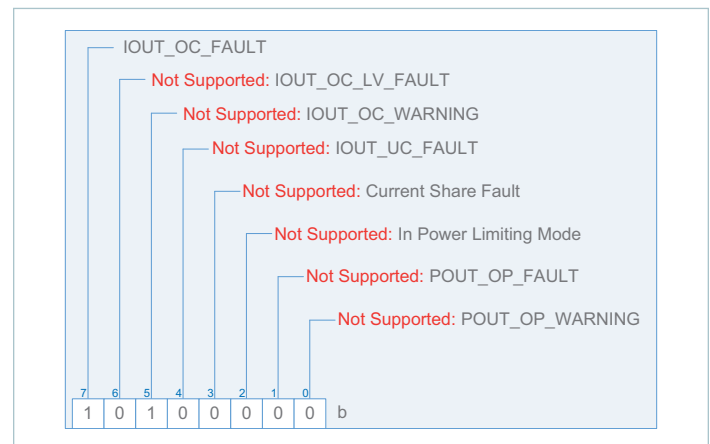

The Busy bit can be cleared using CLEAR\_ALL Command (03h) or by writing either data value (80h) using the STATUS\_BYTE (78h).

Fault reporting, such as SMBALERT# signal output, and Host notification by temporarily acquiring bus parent status is not supported.

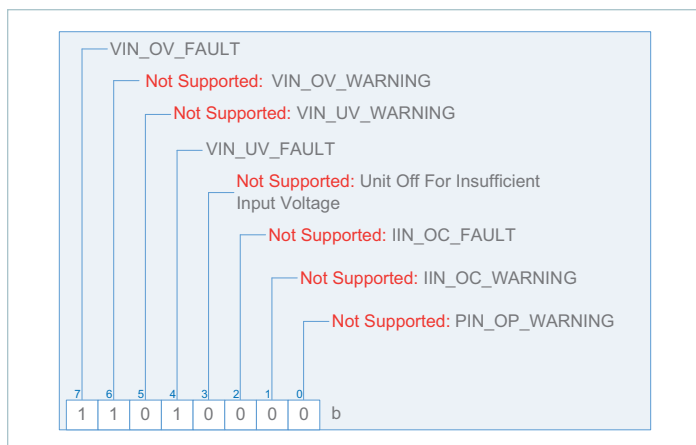

If the BCM is powered by  $V_{HI} \geq V_{\mu C-ACTIVE}$ , it will retain the last telemetry data and this information will be available to the user via a PMBus Status request. This is in agreement with the PMBus standard, which requires that status bits remain set until specifically cleared. Note that in the case where the BCM  $V_{IN}$  is lost, i.e.,  $V_{\mu C-ACTIVE} \leq V_{HI} \leq V_{HI\_UVLO+}$ , the status will always indicate an undervoltage fault, in addition to any other fault that occurred.

NONE OF THE ABOVE bit will be asserted if either the STATUS\_MFR\_SPECIFIC (80h) or the High Byte of the STATUS WORD is set.

## STATUS\_IOUT (7Bh)

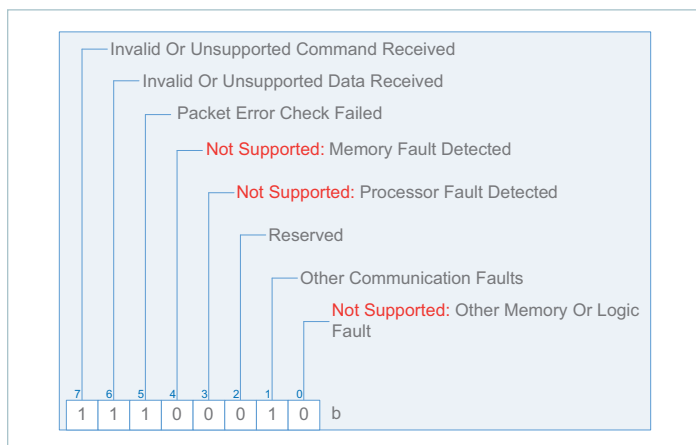

Unsupported bits are indicated above. A one indicates a fault.

**STATUS\_INPUT (7Ch)**

Unsupported bits are indicated above. A one indicates a fault.

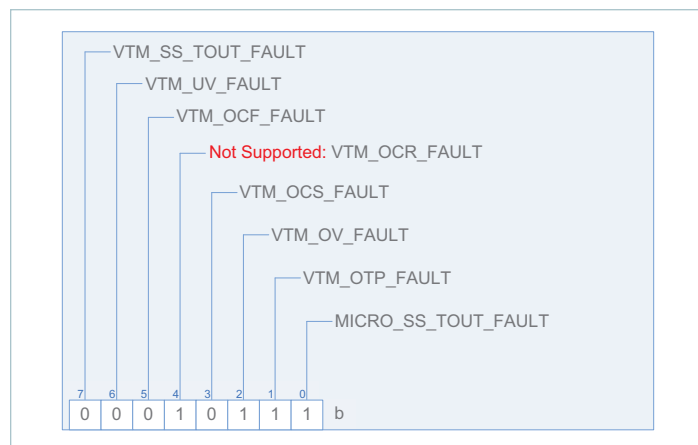

**STATUS\_TEMPERATURE (7Dh)**

Unsupported bits are indicated above. A one indicates a fault.

**STATUS\_CML (7Eh)**

Unsupported bits are indicated above. A one indicates a fault.

The STATUS\_CML data byte will be asserted when an unsupported PMBus® command or data or other communication fault occurs.

**STATUS\_MFR\_SPECIFIC (80h)**

The BCM consists of a supervisory microcontroller and a powertrain controller. This register reports powertrain controller faults. The VTM\_SS\_TOUT\_FAULT, if asserted, indicates a soft-start timeout fault. VTM\_UV\_FAULT and VTM\_OV\_FAULT report undervoltage and overvoltage fault conditions reported by the powertrain controller. In the event of an short circuit condition, the VTM\_OCF\_FAULT will be asserted. An overcurrent condition is indicated by the VTM\_OCS\_FAULT bit. The powertrain controller monitors the BCM internal temperature. An overtemperature shut-down condition is indicated by assertion of the VTM\_OTP\_FAULT bit.

The MICRO\_SS\_TOUT\_FAULT bit, if asserted, refers to a soft-start time-out condition detected by the supervisory controller.

Unsupported bits are indicated above. A one indicates a fault.

**READ\_EOUT (87h)**

This command returns output (LO side) energy metering data for computation of average output power delivery. A read will return 6 bytes of data as defined in the following table. The user shall use the BLOCK READ command structure specified in SMBus specification and also listed as an example in this document. Deviation from this table generates a communication error in STATUS\_CML register.

Byte	Description
0	Instantaneous power accumulator low byte
1	Instantaneous power accumulator high byte
2	Accumulator rollover counter
3	Sample count low byte
4	Sample count mid byte
5	Sample count high byte

The two-byte accumulator holds the cumulative sum of the BCM instantaneous low-voltage-side output power computed by multiplying the LO-side output voltage by the LO-side output current at a regular sampling interval. The two bytes of the accumulator are encoded in DIRECT FORMAT as defined in the PMBus® Specification v1.3. The accumulator rollover counter is one byte and increments each time the two-byte accumulator overflows. The sample count (three bytes) increments each time the LO-side output power is sampled and summed into the accumulator. Overflow events of the accumulator rollover-counter byte and sample-count bytes must be accounted for by the Host for correct data interpretation.

Average output power is computed by the Host from two readings of the READ\_EOUT command. Each read of the READ\_EOUT command requires that the total LO-side output energy count be calculated based on the returned power accumulator reading and the rollover count.

$$\begin{aligned} \text{Energy\_Count} = & \\ & \text{Rollover\_Count} \cdot \text{Maximum\_Direct\_Format\_Value}(m,b,R) \\ & + \text{Accumulator\_Value} \end{aligned}$$

Where:

The maximum DIRECT FORMAT value is a function of the values of m, b and R:

$$\begin{aligned} \text{Maximum\_Direct\_Format\_Value}(m,b,R) = & \\ & \frac{I}{m} \cdot (Y_{MAX} \cdot 10^{-R} - b) \end{aligned}$$

and

$$\begin{aligned} Y_{MAX} = & 2^{15} - 1 \\ = & 32,767 \end{aligned}$$

The average LO-side output power can be computed based on the above calculations performed on each set of READ\_EOUT data and the returned sample count.

$$\begin{aligned} \text{Average\_Power} = & \\ & \frac{\text{Current\_Energy\_Count} - \text{Last\_Energy\_Count}}{\text{Current\_Sample\_Count} - \text{Last\_Sample\_Count}} \text{ (W)} \end{aligned}$$

Information provided by this command is independent of the BCM specific averaging period and sampling frequency. The sample count update rate is 102400μs.

**Example**

Where:

$$\begin{aligned} V_{LO} &= 48\text{V} \\ I_{LO} &= 65\text{A} \end{aligned}$$

Last-read EOUT\_COMMAND data:

$$\begin{aligned} \text{Accumulator count} &= 28080 \\ \text{Rollover count} &= 0 \\ \text{Sample count} &= 9 \end{aligned}$$

Calculations on last read:

$$\begin{aligned} \text{Energy\_Count} &= 28080 + (0 \cdot 32767) \\ &= 28080 \end{aligned}$$

Current-read EOUT\_COMMAND data:

$$\begin{aligned} \text{Accumulator count} &= 2868 \\ \text{Rollover count} &= 36 \\ \text{Sample count} &= 379 \end{aligned}$$

Calculations on current read:

$$\begin{aligned} \text{Energy\_Count} &= 2868 + (36 \cdot 32767) \\ &= 1182480 \end{aligned}$$

Average Power Calculation:

$$\begin{aligned} \text{Average\_Power} &= \frac{(1182480 - 28080)}{(379 - 9)} \\ &= 3120\text{W} \end{aligned}$$

**READ\_VOUT Command (8Bh)**

Returns the BCM's low-side voltage  $V_{LO}$  in the following format:

$$V_{OUT\_ACTUAL} = V_{OUT\_REPORTED} \cdot 10^{-2}(V)$$

**READ\_IOUT Command (8Ch)**

Returns the BCM's low-side current  $I_{LO}$  in the following format:

$$I_{OUT\_ACTUAL} = I_{OUT\_REPORTED} \cdot 10^{-2}(A)$$

**READ\_TEMPERATURE\_1 Command (8Dh)**

Returns the BCM's temperature in the following format:

$$T_{ACTUAL} = \pm T_{REPORTED} (^{\circ}C)$$

**READ\_POUT Command (96h)**

Returns the BCM's low-side power  $P_{LO}$  in the following format:

$$P_{OUT\_ACTUAL} = P_{OUT\_REPORTED} (W)$$

**MFR\_VIN\_MIN Command (A0h),  
MFR\_VIN\_MAX Command (A1h),  
MFR\_VOUT\_MIN Command (A4h),  
MFR\_VOUT\_MAX Command (A5h),  
MFR\_IOUT\_MAX Command (A6h),  
MFR\_POUT\_MAX Command (A7h)**

These values are set by the factory and indicate the device input-side/output-side voltage and output-side current range and output-side power capacity.

These commands report the rated BCM input-side (HI) voltage minimum and maximum in volts, output-side (LO) voltage minimum and maximum in volts, output-side (LO) current maximum in amperes and output-side (LO) power maximum in watts.

**READ/WRITE USER DATA\_00 (B0h) and  
READ/WRITE USER DATA\_01 (B1h) Commands**

A direct communication to the BCM controller for access of User Data by the B0h – B3h commands is supported.

The supported commands B0h and B1h allow write and read of 28 bytes of data to and from non-volatile memory when the BCM is disabled, as defined in the following tables. A write stores a fixed length data payload of 28 bytes in EEPROM. A read will return the same 28 byte fixed length payload. The user shall use the BLOCK READ/WRITE command structure specified in SMBus™ specification also listed as an example in this document. Deviation from this table generates a communication error in STATUS\_CML register.

**READ/WRITE USER DATA\_00 Command (B0h)**

Byte	Description	Values
0	See table below	Action Description Byte
1:28	Data (28 user-programmable bytes)	Data_1, Data_2, ..., Data_28

Byte	Values	Description
0	0	Reserved
	1	<b>Write:</b> Write the 28-byte password protected user data
	2	Reserved
	3	<b>Set WR Protection:</b> Byte 1:28 – 0xff <b>Remove WR Protection:</b> Byte 1:28 – 0x00

**READ/WRITE USER DATA\_01 Command (B1h)**

Byte	Description	Values
0	Write	1 – Write
1:28	Data (28 user-programmable bytes)	Data_1, Data_2, ..., Data_28

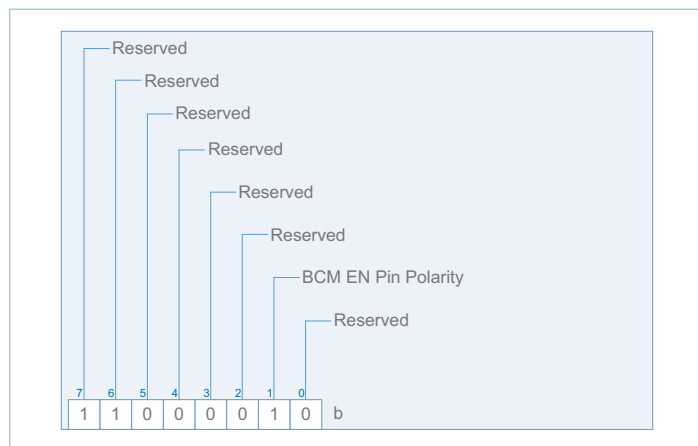

The supported commands B2h and B3h allow write and read of 255 bytes of data to and from non-volatile memory when the BCM is disabled, as defined in the following tables. A write stores a fixed length data payload of 255 bytes in EEPROM. A read will return the same 255 byte fixed length payload. The user shall use the BLOCK READ/WRITE command structure specified in SMBus™ specification also listed as an example in this document. Deviation from this table generates a communication error in STATUS\_CML register.

**READ/WRITE USER DATA\_02 Command (B2h)**

Byte	Description	Values
0:254	Data (255 user programmable bytes)	Data_0, Data_1, ..., Data_254

**READ/WRITE USER DATA\_03 Command (B3h)**

Byte	Description	Values
0:254	Data (255 user programmable bytes)	Data_0, Data_1, ..., Data_254

**BCM\_EN\_POLARITY Command (D0h)**

The value of this register is set in non-volatile memory and can only be written when the BCM is disabled. This command defines the polarity of the EN terminal. If BCM\_EN\_POLARITY is set, the BCM will start up once  $V_{HI}$  is greater than the undervoltage threshold. The BCM EN terminal is internally pulled up to 3.3V. If the BCM\_EN\_POLARITY is cleared, an external pull-down is then required. In this case, applying  $V_{HI}$  greater than the undervoltage threshold will not suffice to start the BCM.

**READ\_K\_FACTOR Command (D1h)**

Returns the BCM's K factor in the following format:

$$K\_FACTOR_{ACTUAL} = K\_FACTOR_{REPORTED} \cdot 2^{-16}(V/V)$$

The K factor is defined in the BCM to represent the ratio of the transformer winding and hence is equal to  $V_{OUT} / V_{IN}$ .

## Data Transmission Faults Implementation

This section describes data transmission faults as implemented in the BCM.

Section	Description	Response to Host		STATUS_BYTE	STATUS_CML			Notes
		NACK	FFh	CML	Other Fault	Unsupported Data	PEC Failed	
10.8.1	Corrupted data						X	
10.8.2	Sending too few bits			X	X			
10.8.3	Reading too few bits			X	X			
10.8.4	Host sends or reads too few bytes			X	X			
10.8.5	Host sends too many bytes	X		X				
10.8.6	Reading too many bytes		X	X	X			
10.8.7	Device busy	X	X					Device will ACK own address BUSY bit in STATUS_BYTE even if STATUS_WORD is set

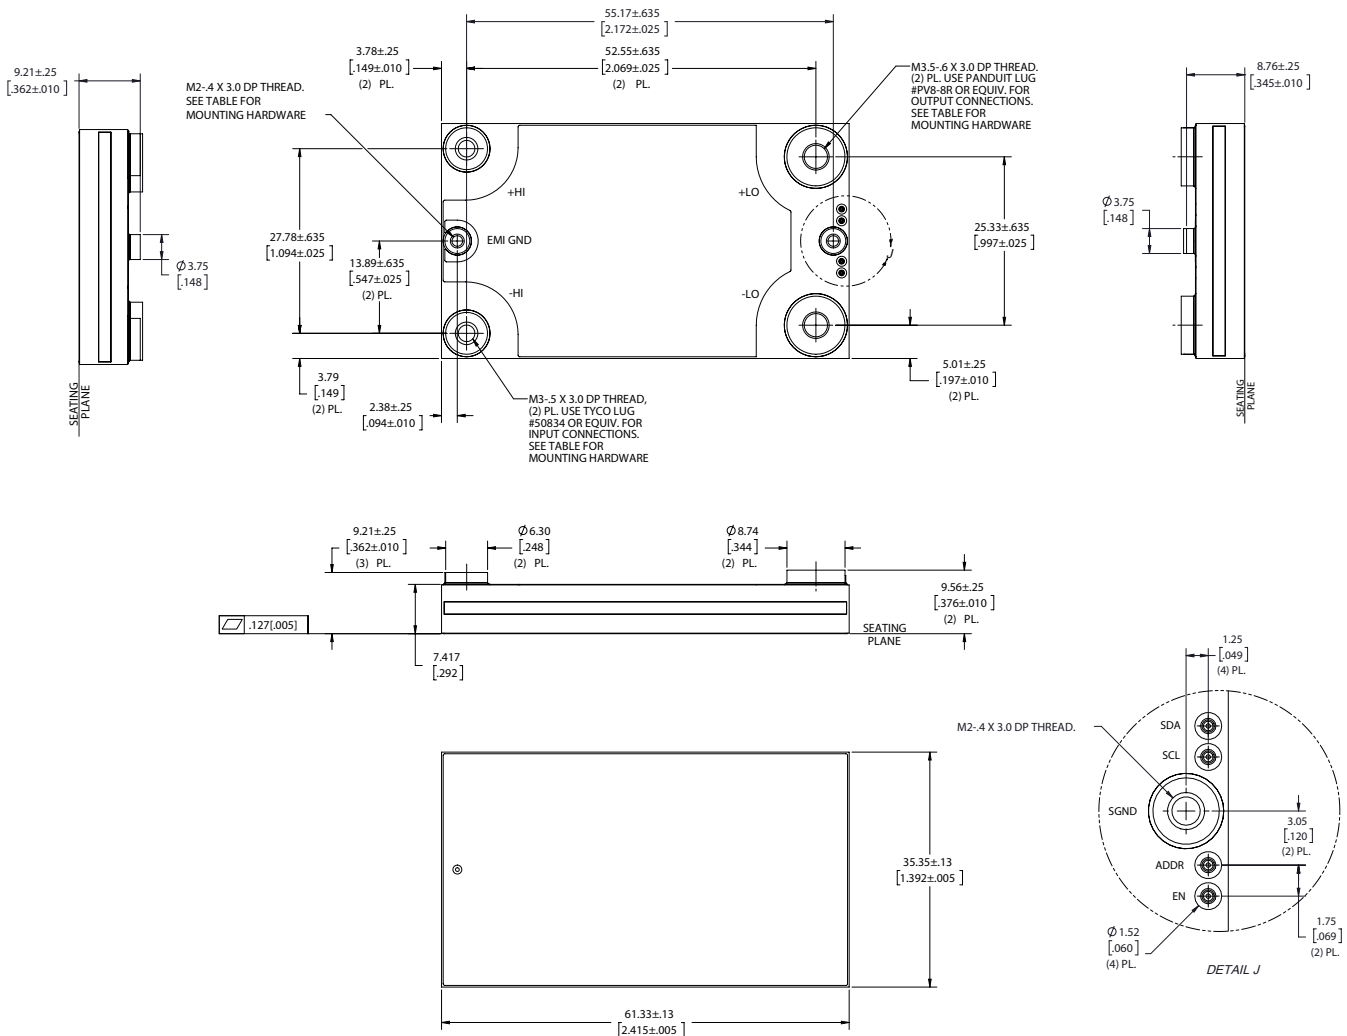

## Data Content Faults Implementation

This section describes data content fault as implemented in the BCM.

Section	Description	Response to Host	STATUS_BYTE	STATUS_CML			Notes
		NACK	CML	Other Fault	Unsupported Command	Unsupported Data	
10.9.1	Improperly set read bit in the address byte	X	X	X			No response
10.9.2	Unsupported command code	X	X		X		
10.9.3	Invalid or unsupported data		X			X	
10.9.4	Data out of range		X			X	
10.9.5	Reserved bits						No response; not a fault

## Mechanical Drawing

BCM6135 TC7\_5  
(Reference DWG# 48382 rev 3)

## NOTES:

- 1- UNLESS OTHERWISE SPECIFIED DIMENSIONS ARE MM / [INCH]
- 2- TOLERANCES ARE:  
DECIMALS  
X.XXX [X.XX] = ±0.25 [0.01]  
X.XXX [X.XXX] = ±0.127 [0.005]  
ANGLES = ±1°

Fastener Assemblies Per BCM for use with recommended ring lugs (Input Tyco 50834, output Panduit PV8-8R)					
Fastener Size	Qty	Screw	Belleville	Flat	Torque
M2 screw/Belleville/flat	1	M2 x 4 (McMaster 92000A011)	Maryland Prec. Spring SSP-52203	Vicor 43985	0.8 in-lb
M3 screw/Belleville/flat	2	M3 x 4 (McMaster 92000A113)	Vicor 43440	Vicor 43985	6 in-lb
M3.5 screw/Belleville/flat	2	M3.5 x 5 (McMaster 92000A150)	Vicor 43441	McMaster 98017A615	8.5 in-lb

Revision History

Revision	Date	Description	Page Number(s)
1.0	06/08/21	Initial release	n/a
1.1	04/25/22	Updated agency approvals Revised view description for terminal configuration and thermal model	1, 4 3, 19
1.2	03/07/24	Revised outline drawing	34

**Vicor's comprehensive line of power solutions includes high density AC-DC and DC-DC modules and accessory components, fully configurable AC-DC and DC-DC power supplies, and complete custom power systems.**

Information furnished by Vicor is believed to be accurate and reliable. However, no responsibility is assumed by Vicor for its use. Vicor makes no representations or warranties with respect to the accuracy or completeness of the contents of this publication. Vicor reserves the right to make changes to any products, specifications, and product descriptions at any time without notice. Information published by Vicor has been checked and is believed to be accurate at the time it was printed; however, Vicor assumes no responsibility for inaccuracies. **Vicor's Standard Terms and Conditions and Product Warranty**

All sales are subject to Vicor's Standard Terms and Conditions of Sale, and Product Warranty which are available on Vicor's webpage (<https://www.vicorpower.com/termsconditionswarranty>) or upon request.

**Life Support Policy**

VICOR'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF VICOR CORPORATION. As used herein, life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness. Per Vicor Terms and Conditions of Sale, the user of Vicor products and components in life support applications assumes all risks of such use and indemnifies Vicor against all liability and damages.

**Intellectual Property Notice**

Vicor and its subsidiaries own Intellectual Property (including issued U.S. and Foreign Patents and pending patent applications) relating to the products described in this data sheet. No license, whether express, implied, or arising by estoppel or otherwise, to any intellectual property rights is granted by this document. Interested parties should contact Vicor's Intellectual Property Department.

The products described on this data sheet are protected by the following U.S. Patents Numbers:  
9,516,761 and other patents pending.
